

Extend Cardiac Expertise Beyond Your Hospital

The challenge

Critical Access Hospitals are responsible for caring for patients who may present with cardiac symptoms—often without on-site cardiology expertise or the resources to maintain a dedicated cardiac diagnostic infrastructure.

Every additional step—device logistics, patient travel, report review, specialist access, or delayed results—can add complications and stress to care.

A complete cardiac monitoring service, built around your hospital

We provide the infrastructure and expertise needed to extend cardiac diagnostic capability without requiring your hospital to build and manage it all internally.

We manage the devices.

We provide and manage a range of cardiac monitoring devices suited to different patient needs, including age, body size, skin sensitivity, and activity level. We manage inventory, logistics, deployment and returns, eliminating the need to procure and manage a costly monitor inventory to cover the wide range of patient needs.

We bring the device to the patient.

When appropriate, devices can be shipped directly to the patient's home, reducing unnecessary clinic visits and allowing for a faster and more convenient patient onboarding experience.

We provide the interpretation.

Technicians analyze the patient data and prepare the report, followed by cardiologist overread—so your clinical team does not have to routinely review technician-generated reports before receiving the completed interpretation.

We deliver on time.

Reports are delivered the next business day, typically first thing in the morning, providing reliable and consistent turnaround for your clinical workflow.

What this gives your hospital

- Access to cardiac monitoring expertise without maintaining equivalent on-site infrastructure
- Less staff time spent managing devices and inventory
- Fewer patient visits required simply to initiate monitoring
- A completed interpretation supported by cardiologist overread
- Predictable, next-business-day reporting
- A scalable service that can expand with your growing patient volume

The outcome

Keep cardiac monitoring local while leveraging the full scope and expertise of our cardiac monitoring solution and infrastructure.
