

Bring Timely Cardiac Expertise Closer to Rural Patients

The challenge

Distance, specialist scarcity, and workforce constraints can make cardiac diagnostics harder to deliver locally. Rural organizations vary widely—from hospitals to clinics and physician practices—so the solution must adapt to the established care model.

A complete cardiac monitoring service that adapts to your organization

We provide the devices, logistics, interpretation, and reporting infrastructure needed to extend complete cardiac monitoring care without requiring every rural organization to build it independently.

We take device logistics out of your hands.

Our range of devices accommodates different patient needs, including age, size, sensitive skin, and athletic activity. We manage inventory and logistics, eliminating the need to procure and manage a costly monitor inventory to cover the range of patient needs.

We can bring monitoring directly to the patient.

Devices can be delivered directly to patients at home when appropriate, reducing travel and eliminating an unnecessary clinic visit.

We provide completed interpretations.

Technicians analyze the data and prepare the final report, followed by cardiologist overread. Your team receives the completed interpretation without having to routinely review technician reports.

We deliver predictably.

Next-business-day reporting—usually first thing in the morning—provides a reliable and consistent turnaround regardless of your organization's location.

What this gives rural providers

- Greater local access to cardiac monitoring expertise
- Less dependence on locally available specialty resources
- Reduced device-management and inventory burden
- Fewer patient travel requirements
- Predictable, cardiologist-overread reporting
- A scalable model that can adapt to a range of rural care settings and demands

The outcome

Extend cardiac diagnostic capability locally while leveraging the full scope of our cardiac monitoring expertise and infrastructure.

Explore a cardiac monitoring solution matched to your organization's existing care delivery model and exacting standards of patient care.
